                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The sequences given in AAQ41767-825 represent sequences which are bound in an electrophoretic mobility shift assay (EMSA) by Myc. The isolated sequences contain the central E box core of CACGTG which binds very weakly with Myc homo-oligomers (C1 complex). The C2 complex tightly with Myc hetero-oligomers (C2 complex). The C2 complex requires a 26-29 kD factor in addition to Myc. The additional factor copurifies with Myc and resembles Max protein. A second copurifying 40-50 kD factor has been identified (forming C2 complex). Sites selected by the C2 complex contain the core CAGCTG which bears remarkable homology to a myogenin binding site (see AAQ41763). Oligonucleotides containing the E box can be used in the purification of Myc from a mammalian source. See also AAQ41761-861. The isolated activity

CC The present sequence is that of a synthetic BCG (Bacillus C Calmette-Guerin) derived oligonucleotide useful to the invention. The CC invention relates to a composition, comprising a 2 to 20 base 3'-OH, CC 5'-OH synthetic oligonucleotide which comprises multiple repeats of CC dinucleotides such as GT, TG, etc., according to specific formula and CC having cytostatic activity. The oligonucleotide compositions are useful CC for inducing cell cycle arrest, inhibition of proliferation, activation CC of caspases and induction of apoptosis or production of cytokines such as CC interleukin (IL)-1-beta, IL-6, IL-10, IL-12 and tumour necrosis factor CC (TNF)-alpha by immune system cells, in an animal having cancer such as CC primary carcinoma, secondary carcinoma, primary sarcoma and secondary CC sarcoma such as, leukemia, lymphoma, breast, prostate, colorectal, CC ovarian or bone cancer. The compositions induce apoptosis independent of CC ras, p53/p21, p21/waf-1/CIP, p15(ink4B), p16(ink4), drug resistance, CC caspase 3, transforming growth factor (TGF)-beta 1 receptor and hormone

Human nucleic acids containing single nucleotide polymorphisms, useful for treating a subject suffering, or at risk from a pathology due to the presence of a sequence polymorphism -

Claim 1; Page 511; 543pp; English.

Sequences AAA76318-A77509 represent 1192 human nucleic acid sequences which contain single nucleotide polymorphisms (SNPs). Sequences 1 to 1112 (AAA76318-A77429) are consecutive pairs of nucleotides which

Sequences 1113 to 1192 (AAA77430-A77509) are CC consecutive pairs of nucleotides containing SNPs which result in changes CC in the corresponding amino acid sequences (AABH1749-B11828). The SNPs in CC sequences 1113 to 1128 (AAA77430-A77445) lead to conservative amino acid C changes, while those in sequences 1129 to 1186 (AAA77446-A77503) result in non-conservative changes. The SNPs in sequences 1187 to 1192 (C (AAA77504-A77509) generate frameshift mutations. The invention also CC relates to a method of detecting a polymorphic site in a nucleic acid and CC a method of determining the relatedness of two nucleic acids. It also CC encompasses peptides containing polymorphic sites, antibodies raised against such peptides, and a method of detecting polymorphic capainst such peptides, and a method of detecting polymorphic CC gene therapy of an individual having, suspected of having, or at risk of CC eveloping a pathological condition due to the presence of a sequence CC polymorphism. Such treatment would comprise administration of the CC wild-type nucleic acid sequence. Antibodies raised against polymorphic capainst polymorphic capainst polymorphic acid sequence. Antibodies raised against polymorphic capainst polymorphic capainst polymorphic capainst such used in the treatment of such individuals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Matches

                           PCR primers AAA63755-56 were used to amplify a murine cDNA sequence encoding a neutral endopeptidase metallopeptidase (NEP)-like polypeptide, designated NL-1. The specification also describes NL-2 NL-3. The NL enzymes are used to test for specific inhibitors. The N-terminal region of the enzymes can be used to promote production
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 NEP-like enzyme; protein production; protein secretion; neurological disease; Alzheimer's disease; pain; psychiatric disorder; fertility; bone disease; abnormal phosphate metabolism; PCR primer; ss
                                                                                                                                                                                                                                                             Novel neutral endopeptidase-like metallopeptidase polypeptides and polynucleotides, used to screen for related sequences and enzyme inhibitors, used for the treatment of NL-3 related bone disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              (UYMO-) UNIV MONTREAL.

determinant (ii) different from the allergen that triggers T cell activation. (I) has antiallergic, antiasthmatic antiinflammatory. dermatological and immunosuppressive activities, and can be used in vaccine. (I) may be used in a pharmaceutical or cosmetic medicament treat and/or prevent allergies or a disease of allergic origin, especially hypersensitivities These include rhinitis, sinusitis, bronchial asthma, atopic dermatitis, some forms of acute and chronic

ç

of

urticaria, gastro-intestinal syndromes

The present invention describes a compound (I) for the prevention a treatment of allergy. The compound comprises at least one allergen antigenic determinant (I) recognised by a B cell of a non-atopic individual and at least one antigenic by a B cell of a non-atopic individual and at least one antigenic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       constructs containing the foreign protein downstream from and in phase with the N-terminal region. The NL enzymes are have been localised to the brain, and may be useful in the treatment of neurological diseases such as Alzheimer's disease, pain, and psychiatric disorders. NL enzymes have also been localised to the testis and ovaries, and may be used to control fertility. They have also been localised to bones, and may be used to treat bone diseases, and abnormal phosphate metabolisms related to improper peptide processing by the NL-3 enzyme.
                                                                                                                                                                                                                                                                                                                                                                                  atopic dermatitis; acute urticaria; chronic urticaria; PCR primer; gastro-intestinal syndrome; food allergen; oro-pharyngeal syndrome;

                                                                                             This nucleotide sequence is that of a primer used in the PCR amplification of 80 bp of DNA 5′ to exon 2 of the human HnRNA A2 gene. The PCR product was used in the construction of a hnRNP A2-epidermal growth factor promoter reporter construct. The human hnRNP A2 gene includes a ubiquitous chromatin opening element (UCOE, see AAZ58411).
              facilitate reproducible expression of an operably linked gene cells of at least 2 different tissue types. The invention provides UCOEs, vectors and host cells useful in gene therapy,
                                                                       UCOEs open chromatin or maintain chromatin in an open state and

                                                                                                                                                                                                                                                                                                                             WPI; 2000-182712/16.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 food allergens, oro-pharyngeal syndrome, anaphylactic reactions associated with drug hypersensitivities and/or a mixture of these. The use of (I) in the treatment of allergic conditions avoids the need for drug treatment, which often causes undesirable side-effects. Also, prio art drug therapies alleviate symptoms, but do not influence their causes, however (I) actually combats the cause of an allergic reaction. The present sequence represents a PCR primer for a B cell epitope from
                                                                                                                                                                                                                       Example; Page 51; 187pp; English.

                                                                                                                        This nucleotide sequence is that of a primer used in the PCR amplification of 1 kb of DNA 5′ to exon 2 of the human HnRNA A2 gene. The PCR product was used in the construction of a hnRNP A2-epidermal growth factor promoter reporter construct. The human hnRNP A2 gene includes a ubiquitous chromatin opening element (UCOE, see AAES8411). UCOES open chromatin or maintain chromatin in an open state and facilitate reproducible expression of an operably linked gene in cells of at least 2 different tissue types. The invention provides UCOEs, vectors and host cells useful in gene therapy, as well as transgenic animals.
                                                                                                    Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  amplification without the inclusion of a modified restriction site required in the prior art strand displacement method, and may be effected isothermally, unlike prior art polymerase chain reaction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This invention describes a novel method for amplifying a nucleic acid sequence of a double-stranded molecule, using a restriction enzyme which cuts to leave a 3' overhang on the strand not to be amplified, strand displacing polymerase. The method allows nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Example
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Amplifying a nucleic acid sequence

encompasses peptides containing polymorphic sites, antibodies raised against such peptides, and a method of detecting polymorphic proteins/peptides using the antibodies. The nucleic acids are useful 1 gene therapy of an individual having, suspected of having, or at risk developing a pathological condition due to the presence of a sequence polymorphism. Such treatment would comprise administration of the
                                                                                                                                                                                                                                                                                                                                            in the corresponding amino acid sequences (AAB11749-B11828). The SNPs in sequences 1113 to 1128 (AAA77430-A77445) lead to conservative amino acid changes, while those in sequences 1129 to 1186 (AAA77446-A77503) result in non-conservative changes. The SNPs in sequences 1187 to 1192 (AAA77504-A77509) generate frameshift mutations. The invention also relates to a method of detecting a polymorphic site in a nucleic acid and a method of determining the relatedness of two nucleic acids. It also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          which contain single nucleotide polymorphisms (SNPs). Sequences 1 1112 (AAA76318-A77429) are consecutive pairs of nucleotides which contain silent SNPs. Sequences 1113 to 1192 (AAA77430-A77509) are consecutive pairs of nucleotides containing SNPs which result in consecutive pairs of nucleotides containing SNPs which result in consecutive pairs of nucleotides containing SNPs which result in consecutive pairs of nucleotides containing SNPs which result in consecutive pairs of nucleotides containing SNPs which result in consecutive pairs of nucleotides containing SNPs which result in consecutive pairs of nucleotides containing SNPs which result in consecutive pairs of nucleotides containing SNPs which result in consecutive pairs of nucleotides containing SNPs which result in consecutive pairs of nucleotides which contains the containing SNPs which result in consecutive pairs of nucleotides which contains the containing SNPs which result in consecutive pairs of nucleotides containing SNPs which result in consecutive pairs of nucleotides containing SNPs which result in consecutive pairs of nucleotides containing SNPs which result in consecutive pairs of nucleotides containing SNPs which result in consecutive pairs of nucleotides containing SNPs which result in consecutive pairs of nucleotides containing SNPs which result in consecutive pairs of nucleotides containing SNPs which result in consecutive pairs of nucleotides containing SNPs which result in consecutive pairs of nucleotides containing SNPs which result in consecutive pairs of nucleotides containing SNPs which result in consecutive pairs of nucleotides containing SNPs which result in consecutive pairs of nucleotides containing SNPs which result in consecutive pairs of nucleotides containing SNPs which result in consecutive pairs of nucleotides containing SNPs which result in containing SNPs which res
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human nucleic acids containing single nucleotide polymorphisms, useful for treating a subject suffering, or at risk from a pathology due to the presence of a sequence polymorphism -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                17-NOV-1998;

```
The present sequence represents a ligase detection reaction (LDR) CC oligonucleotide probe used for the detection of K-ras codon 61, for use CI in present invention. The present invention describes a method for the CC detection of at least 1 minority target nucleic acid (I), present in a CC sample also containing majority nucleic target nucleic acids (II) and CC differing from (II) by at least 1 single-base change, insertion, CC deletion or translocation. The method comprises first treating the CC sample with: (a) ligase, and (b) at least 1 pair of target-specific CC oligonucleotide probes (A) which can be ligated together when hybridised CC adjacent to each other on their target sequence but have a mismatch that C prevents ligation on any other sequence. The reaction mixture is CC subjected to at least 1 ligase detection reaction (LDR) cycle of CC denaturation, hybridisation and ligation, to produce a detectable CC may hybridise to other sequences but will not then be ligated and will CC may hybridise to other sequences but will not then be ligated and will CC may hybridise to other sequences but will not then be ligated to detect any bacterial, viral, fungal or CC cancer associated mutations in the presence of excess wild-type allele. The method can also be used to detect any bacterial, viral, fungal or CC diseases, it is also useful for environmental monitoring, forensic CC industry.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Detecting minority nucleic acid in presence of larger amounts closely related sequences - by ligase detection reaction with specific oligonucleotide probes, also thermostable mutant liga modified probes, used to detect cancer-related mutations
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Example 19; Fig 31B; 190pp; English.

                                                                                                                                                                                                                                                                                                                                                                                         an intron region of the human fibroblast growth factor receptor 1 (FGFR1) gene. It can be used for the PCR amplification of FGFR1 nucleic acid sequences, especially to identify a newly discovered oncogene, ZNF198-FGFR1 (see AAX87177), which incorporates a FGFR1 tyrosine kinase domain fused through t(8:13) translocation to ZNF198, and which is associated with stem cell leukaemia/lymphoma (SCLL) syndrome. The presence of ZNF198-FGFR1 nucleic acid in a tissue or fluid sample from a patient is indicative of SCLL syndrome.
                                                                                                                             Cytomegalovirus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             07-JAN-1999;

The method allows nucleic acid amplification without the inclusion of a modified restriction site required in the prior art strand displacement method, and may be effected isothermally, unlike prior art polymerase chain reaction
                                                                                                                                                                                                       Tumour vaccines contg. antigen for which immune response exists made from autologous and/or allogenic tumour cells modified with antigens, which are transfected, esp. using recombinant DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Synthetic.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Mycobacterium
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       28-MAY-1997

                     infections by a pathogenic microorganism. The recombinant replicable vesiculoviruses are useful in diagnosing and monitoring progression of infectious disorders, including response to vaccination and/or therapy, in cancer immunoprophylaxis, immunotherapy and diagnosis, and monitoring of tumor progression or regression, and to produce large quantities of readily purified antigen.
                                                                                                                                                 The present invetion relates to producing a recombinant replicable vesiculovirus. The method involves culturing a cell containing a firrecombinant nucleic acid that can be transcribed to produce an RNA comprising a vesiculovirus antigenomic (+) RNA containing the vesiculovirus promoter for replication and a ribozyme sequence immediately downstream the antigenomic (+) RNA. The method is useful
                                                                                                                                                                                                                                                                                                 Producing recombinant replicable vesiculovirus, useful as vaccines for treating or preventing microbial infections, comprises culturing a cell containing a nucleic acid for the expression of vesiculovirus antigenomic RNA
                                                                                                                for producing recombinant replicable vesiculoviruses, be used as vaccines for the treatment or prevention of infertions by a substantial microscopic management.
                                                                                                                                                                                                                                                                Disclosure; Column 42; 119pp; English.
                                                                                                                                                                                                                                                                                                                                                                               WPI; 2001-136716/14.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        an immune response already exists, are claimed. The vaccines take advantage of a well defined, already extant cell immune response in host to act against tumour cells. The antigen is preferably from Mycobacterium heat shock protein hsp65. The PCR primers in AAT33699 and AAT33700 were used in the construction of a plasmid for expressing hsp65 in mouse melanoma cells.
